

THE GROUNDING FORCE IN TASK AND WORKFLOW MANAGEMENT

Process rules the world

Gravity is our task and workflow management solution. Like gravity itself, it operates from one basic, natural law: It brings everything together. Cut out the extraneous, enhance the logical, and be well-grounded in support for the projects that will lift your productivity to new heights.

For small and big organizations alike, Gravity syncs and refines workflow processes to allow for fast, easy and visible management of projects, tasks and development across designated teams. Powerful and flexible, it supports process automation and streamlines and controls changes company-wide, regardless of the methodology and terminology used. From software developers to IT executives to business analysts: anyone can count on Gravity to provide firm footing in a world of constant evolution.

WEB OR RICH, YOU'RE ON TASK

Available in rich-client and web-based versions, Gravity avails you free and easy access to your systems anytime, anywhere.

BENEFITS

- Workflow control
- Time, money and frustration saved
- Requirements management
- Workload predictability
- Improved collaboration
- Modern and robust way of working
- Significant increase in employee and machine productivity
- Better team communication
- Laws and regulations compliance (SOX, ISO, COBIT, etc.)
- Future-proof technology
- Quick learning curve
- REST API support

DESIGN YOUR WORKFLOW

With Gravity you will be able to design a workflow with customized items: tasks, requests, issues (consisting of attributes, planning and estimates, description, etc). This defined workflow will show the end-to-end path of these items, from assignment to production. Once the design is complete, Gravity will enforce the whole process for you. Items can be easily assigned to the right people and, once processed within the workflow, immediately updated with the appropriate status.

EXTEND ACCORDING TO YOUR NEEDS

Tailor your workflow with customized activities, such as sending emails, managing your calendar, or more complex tasks like starting a build on a build-server or enforcing users to enter sign-on information.

CONTROL AND PREDICT WORKLOAD

Project management can be facilitated on both a detailed and summarized level. Project managers will benefit from the ability to manage individual task time estimates and team member workloads. This enables full control and visibility of project workloads and time requirements for an entire project. Single tasks as well as entire projects can be managed within Gravity. In Gravity rich client, individual users can manage their own work better by personalizing their views.

Innovative DevOps solutions for IBM i for today and the future

IMPROVE COMMUNICATION FLOW

Gravity facilitates information flow between multiple teams and team members. It registers all changes that take place within a company and sends change-related notifications. You can easily define what type of changes are important to you and whether or not you want to be informed about them.

Gravity users can also specify notification receipt times and where they'd like to receive them – in their mailbox, on a smartphone or other device, etc.

Streamlining communication within Gravity also facilitates defining and assigning changes, requests, or issues to the people involved. These changes can be described in stories and then split into multiple tasks with defined deadlines or time frames. The user responsible for completing the task will be notified about it immediately.

All Gravity users can see the work assigned to them and others and view task status and schedules.

CHANGE | WORKFLOW | DEVOPS'

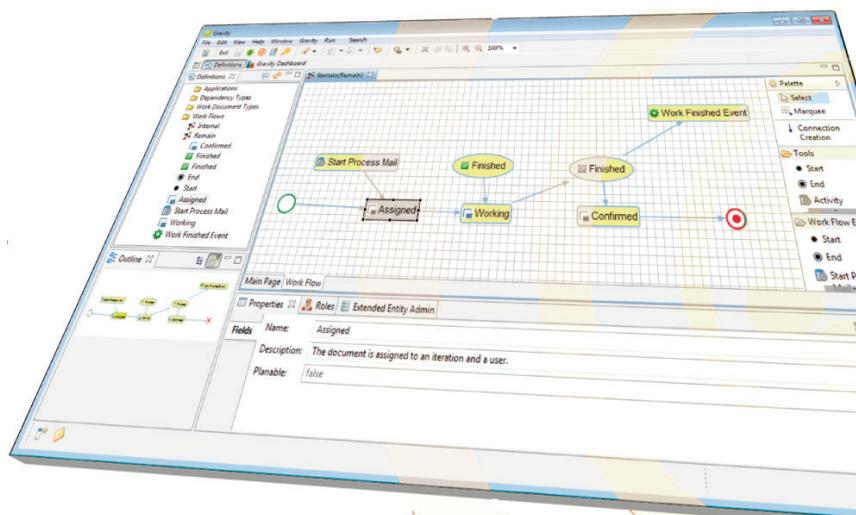

When integrated with TD/OMS, our powerful change/lifecycle-management tool, Gravity completes this critical development triad for significant, synergistic enhancement to end-to-end development cycles.

"Our community uses Gravity as our central tracker, where all issues and enhancement requests are filed and (by default) visible to the complete community. Sure, it hurts our feelings when someone exposes an issue that we would rather not have in the open, but this also means we cannot hide. It's a strategy that compels us to fix things." — **Wim Jongman, Chief Technology Officer Remains Software**

FEATURES

- Methodology independent process automation (AGILE, Scrum, Waterfall, XP, "the next great thing"™, etc.).
- Workflow design with customized documents, tasks and user roles.
- Support for project management.
- Task management and process automation.
- Activity personalization (e.g.: sending e-mail, calendar management, starting a build on a build-server, enforcing users to enter sign-off information, etc.).
- Event management (event processors to perform all sorts of tasks like auditing, process triggering, notification, e-mail and more).
- Access through web or rich client.
- Project management support with individual task time estimates and team member workloads.
- Notification system improving information flow between multiple teams and team members (changes/requests/problems defined and assigned to particular employees with defined deadlines or timeframes).
- Integration with TD/OMS application lifecycle management.
- Strong security capabilities with users' authorization and authentication.
- Social features, like following or tagging.
- Eclipse, Service Oriented Architecture (SOA), OSGI, Multiplatform (Java) and Multi Data base.
- Graphical presentation of item relations.
